Mobile Sales Performance & Customer Insights Dashboard

Project documentation | Power BI

About the Project

This project is an interactive Power BI dashboard built to explore mobile sales and customer-related data in one place. It brings important sales figures and customer indicators together so that users can quickly understand how sales are performing and where they may need to look more closely.

The dashboard allows users to view results by year and month, compare sales across cities and brands, and explore payment methods and customer ratings. The aim is to make the data easier to understand and more useful when reviewing business performance.

What the Dashboard Shows

- **Sales overview:** Total sales, average sales, number of sales, and product quantity.
- **Monthly trend:** How sales change from month to month.
- **City-wise performance:** A geographic view of sales across different cities.
- **Brand analysis:** A comparison of brands and their distribution across cities.
- **Payment methods:** A breakdown of transactions by payment type.
- **Customer ratings:** A view of the ratings provided by customers.
- **Interactive filters:** Year and month selections that help users focus on a specific period.

Tools Used

- **Microsoft Power BI** – Building the dashboard and presenting the data.
- **DAX** – Creating measures and calculating key performance indicators.
- **Power Query** – Preparing and transforming data.
- **Microsoft Excel** – Working with the dataset, where applicable.

Why This Dashboard Is Useful

The dashboard helps users spot changes in sales, compare the performance of different cities and brands, and understand customer ratings and payment patterns. Instead of checking separate reports, users can explore these details through one interactive view and use the findings to support business decisions.

How to View the Project

- Download or clone the project repository from GitHub.
- If the Power BI report file (.pbix) is included, open it using Power BI Desktop.
- Use the year and month filters to explore the available data.
- Select different charts or data points to view related information across the dashboard.

Project Goal

The goal of this project is to turn sales data into clear and useful insights. By bringing sales trends, city and brand comparisons, payment information, and customer ratings together, the dashboard makes it easier to

review performance and make informed decisions.

Note: The figures and calculations shown in the dashboard depend on the dataset and the measures used in the Power BI report.
